# CLEAN CODE

## YOU SHOULD

- Keep It Simple, Stupid (KISS)

- Leave the Code cleaner than you found it

- be able to extend a classes behavior without modifying it.

- Name your variable, field, property precise

- Name a Method so, that you know what it does, not how

## YOU SHOULDN'T

- add functionality on top, but simplify overall.

- Add a prefix or type/scope information to a name

- Write unnecessary comments

- Write Code that does not add any functionality

- Repeat yourself
